

Applying Business Process Modeling Notation (BPMN) in Healthcare

International Workshop on Ubiquitous Healthcare
and Supporting Technologies 2010

31.5 – 2.6.2010 Shanghai

Timo Itälä M.Sc.
Aalto University

Content

- In this tutorial the concepts of business processes are explained and business process modeling using the global standard notation BPMN (Business Process Modeling Notation) is introduced.
- The approach on how to identify services and design business processes based on Service Oriented Architecture (SOA) is explained.
- Concepts of data modeling related to business process and service modeling are introduced.
- A practical case study related to health care processes and integration of hospital information systems is given.

What is a Business Process?

Our **organization** produces **products** and **services** for our **customers**.

The products and services are results of our **core business processes**.

Support processes give support to the core processes.

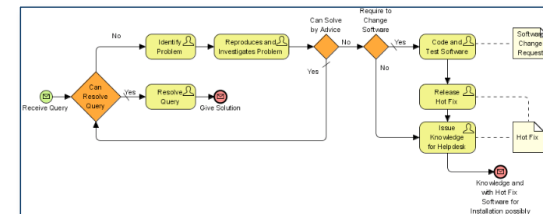

Management processes govern the operation of the system.

The processes need **information** which can be processed by our **applications** which run on our **infrastructure**.

A definition of a Business Process

- ❑ A **business process** or **business method** is a collection of related, structured activities or **tasks** that produce a specific service or product (serve a particular goal) for a particular customer or customers. It often can be visualized with a **flowchart** as a **sequence of activities**. (Wikipedia)

Types of processes and flows

- ☐ Real process
 - ☐ Flow of material, people, products, services etc.
- ☐ Financial process
 - ☐ Flow of money
- ☐ Information flow
 - ☐ Flow of data
- ☐ Business process
 - ☐ Flow of tasks and messages

Business processes within healthcare

- ☐ Clinical process
 - ☐ How the patient is treated
 - ☐ Diagnosis – treatment
 - ☐ Observations, tests, operations, medication
 - ☐ Executed by doctors: Give orders
- ☐ Nursing process
 - ☐ How the patient is taken care
 - ☐ Executed by nurses: Carry out orders
- ☐ Financial process
 - ☐ Collection of payments
 - ☐ The cashiers
- ☐ Scheduling process
 - ☐ Scheduling appointments
 - ☐ The assistants
- ☐ Patient record process
 - ☐ Doctors, Patients, other staff

A Model and an Instance of a Business Process

A Model of a business process describes how product and services are produced

An Instance of a business process produces an uniquely identifiable product or service to an uniquely identifiable customer

Business process modeling and information modeling go hand-in-hand

Why model business processes?

If we want to improve how we do things we must first understand how we do things today

- ☐ First we model as-is
- ☐ Then we look at the problems or opportunities for improvement
- ☐ Then we choose the most important improvements
- ☐ Then we model the to-be

Modeling business processes

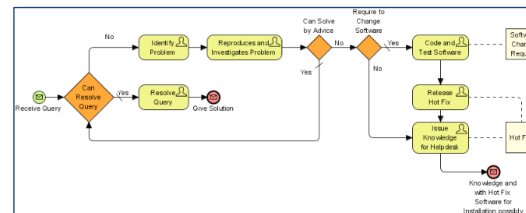

How to model and represent business processes?

- ☐ Verbal, textual descriptions
- ☐ Visual diagrams
- ☐ Execution instructions

1. Starting with a customer placing an order **(the customer need)**
2. send IT-based information to the warehouse
3. stock picking
4. packing and recording
5. sending the appropriate IT-based information to the distribution hub
6. sending IT-based information to the accounts department
7. generation of an invoice
8. allocation and organisation of shipment for the vehicle drivers
9. delivery of the item and invoicing **(the customer need fulfilled).**

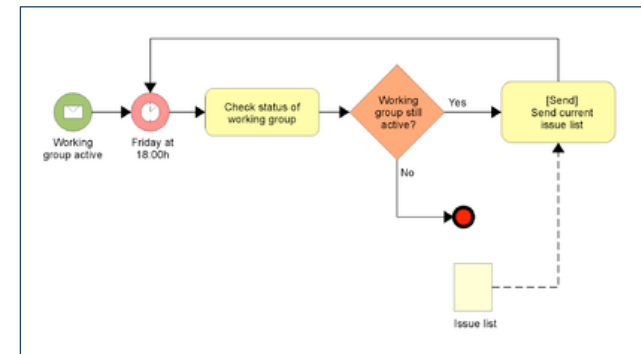

```
<process name="EmailVotingProcess">
  <!-- The Process data is defined first-->
  <sequence>
    <receive partnerLink="Internal" portType="tns:processPort"
      operation="receiveIssueList" variable="processData"
      createInstance="Yes"/>
    <invoke name="ReviewIssueList" partnerLink="Internal"
      portType="tns:internalPort" operation="sendIssueList"
      inputVariable="processData" outputVariable="processData"/>
    <switch name="AnyIssuesready">
      <!-- name="Yes" -->
      <case condition="!<var>getVariableProperty(ProcessData, NumIssues)>0">
        <invoke name="DiscussionCycle" partnerLink="Internal"
          portType="tns:processPort" operation="callDiscussionCycle"
          inputVariable="processData"/>
        <!-- Other Activities not shown -->
      </case>
      <!-- name="No" -->
      <empty/>
    </switch>
  </sequence>
</process>
```

Business Process Modeling Notation (BPMN)

- ❑ BPMN is a graphical representation for specifying business processes in a workflow
- ❑ BPMN was developed by Business Process Management Initiative (BPMI)
- ❑ BPMN is currently maintained by the Object Management Group (OMG) since 2005
- ❑ BPMN 2.0 published recently
- ❑ Tool support: (62 listed)
 - ❑ Drawing tools
 - ❑ Repository based modeling tools

Level of Detail?

Level 1: Conceptual, Descriptive

Level 2: Logical, Analytical

Level 3: Physical, Executable

	DATA <i>What</i>	FUNCTION <i>How</i>	NETWORK <i>Where</i>	PEOPLE <i>Who</i>	TIME <i>When</i>	MOTIVATION <i>Why</i>	
SCOPE (CONTEXTUAL)							SCOPE (CONTEXTUAL)
<i>Flavor</i>	Entity = Class of Business Thing	Function = Class of Business Process	Node = Major Business Location	People = Major Organizations	Time = Major Business Event	End/Means = Major Bus. Goal/Critical Success Factor	<i>Flavor</i>
ENTERPRISE MODEL (CONCEPTUAL)	e.g. Semantic Model	e.g. Business Process Model	e.g. Logistics Network	e.g. Work Flow Model	e.g. Master Scheduling	e.g. Business Plan	ENTERPRISE MODEL (CONCEPTUAL)
<i>Owner</i>	Ent = Business Entity Rel = Business Relationship	Proc = Business Process IO = Business Resource	Node = Business Location Link = Business Linkage	People = Organization Unit Work = Work Product	Time = Business Event Cycle = Business Cycle	End = Business Objective Means = Business Strategy	<i>Owner</i>
SYSTEM MODEL (LOGICAL)	e.g. Logical Data Model	e.g. 'Application Architecture'	e.g. 'Distributed System Architecture'	e.g. Human Interface Architecture	e.g. Processing Structure	e.g. Business Rule Model	SYSTEM MODEL (LOGICAL)
<i>Designer</i>	Ent = Data Entity Rel = Data Relationship	Proc = Application Function IO = User Views	Node = IS Function (Processes, Storage, etc.) Link = Data Characteristics	People = Role Work = Deliverable	Time = System Event Cycle = Processing Cycle	End = Structural Assertion Means = Action Assertion	<i>Designer</i>
TECHNOLOGY MODEL (PHYSICAL)	e.g. Physical Data Model	e.g. 'System Design'	e.g. 'System Architecture'	e.g. Presentation Architecture	e.g. Control Structure	e.g. Rule Design	TECHNOLOGY MODEL (PHYSICAL)
<i>Builder</i>	Ent = Segment/Table/etc. Rel = Pointer/Key/etc.	Proc = Computer Function IO = Screen/Device Formats	Node = Hardware/System Software Link = Link Specifications	People = User Work = Screen Format	Time = Execution Cycle = Component Cycle	End = Condition Means = Action	<i>Builder</i>
DETAILED REPRESENTATIONS (OUT-OF-CONTEXT)	e.g. Data Definition	e.g. 'Program'	e.g. 'Network Architecture'	e.g. Security Architecture	e.g. Timing Definition	e.g. Rule Specification	DETAILED REPRESENTATIONS (OUT-OF-CONTEXT)
<i>Sub-Contractor</i>	Ent = Field Rel = Address	Proc = Language Stmt IO = Control Block	Node = Addresses Link = Protocols	People = Identity Work = Job	Time = Interrupt Cycle = Simulation Cycle	End = Sub-condition Means = Step	<i>Sub-Contractor</i>
FUNCTIONING ENTERPRISE	e.g. DATA	e.g. FUNCTION	e.g. NETWORKS	e.g. ORGANIZATION	e.g. SCHEDULE	e.g. STRATEGY	FUNCTIONING ENTERPRISE

Zachman Institute for Framework Advancement - (810) 231-0531

Business Process Redesign

- ☐ Effectiveness
 - ☐ To do the right things
- ☐ Efficiency
 - ☐ To do things right

BPMN Elements

Example: The Patient in the “Happy Hospital”

Business Process Steps

- ☐ Pay for the book, if you don't have one
- ☐ Pay for the visit
- ☐ Choose the department
- ☐ Wait in the line
- ☐ Meet the doctor
- ☐ Go to the lab
- ☐ Pay for the test
- ☐ Give the sample
- ☐ Get the results form
- ☐ Wait in the line
- ☐ Meet the doctor again
- ☐ The doctor writes the observations and the medication in the book
- ☐ Pay for the medicine
- ☐ Get the medicine

Example: Hospital visit as a BPMN diagram

- ❑ Flow objects: Events, Tasks, Gateways
- ❑ Connecting Objects: Sequence Flow, Annotation
- ❑ Data Objects: Data and Documents in the Process
- ❑ Hiding details: Sub-Process

Hiding details: Sub-Process

Sub-Processes are used to hide and show necessary level of detail

Participants in the processes

Participants

- ☐ Organizations or departments

- ☐ The Hospital
- ☐ The Pharmacy

- ☐ Roles of persons

- ☐ The Patient
- ☐ The Doctor
- ☐ The Nurse
- ☐ The Receptionist

- ☐ How do we represent participants in the processes?

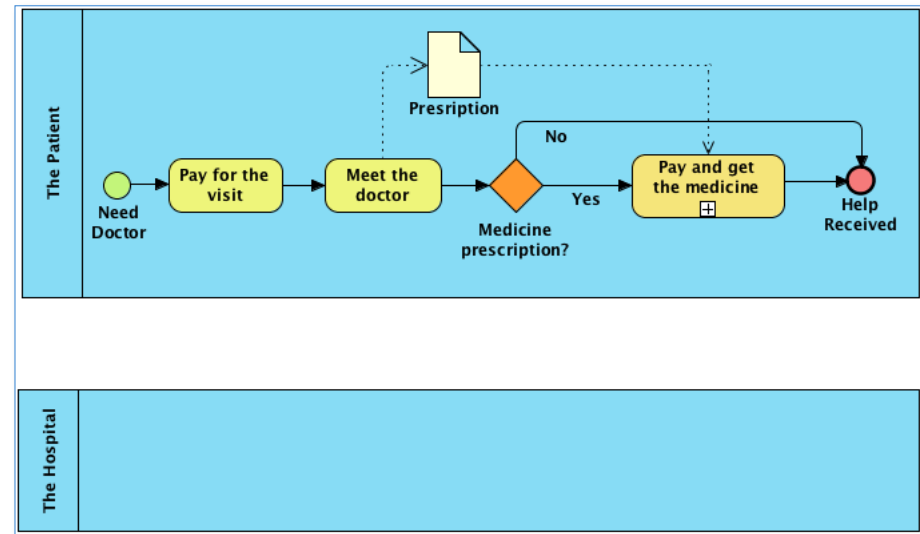

Participants: Swimlanes, Pools and Lanes

- ❑ A Pool represents a process of one participant
- ❑ A Pool can contain sub-partitions to show different roles within a participant
- ❑ Correction: Assistant !

Processes within Pools

- ❑ A Business Process is always within one Pool
- ❑ The Patient Pool:
White-Box pool
- ❑ The Hospital Pool:
Black-Box Pool
- ❑ Participants and their processes can collaborate with each other. How?

Collaboration with messages between processes

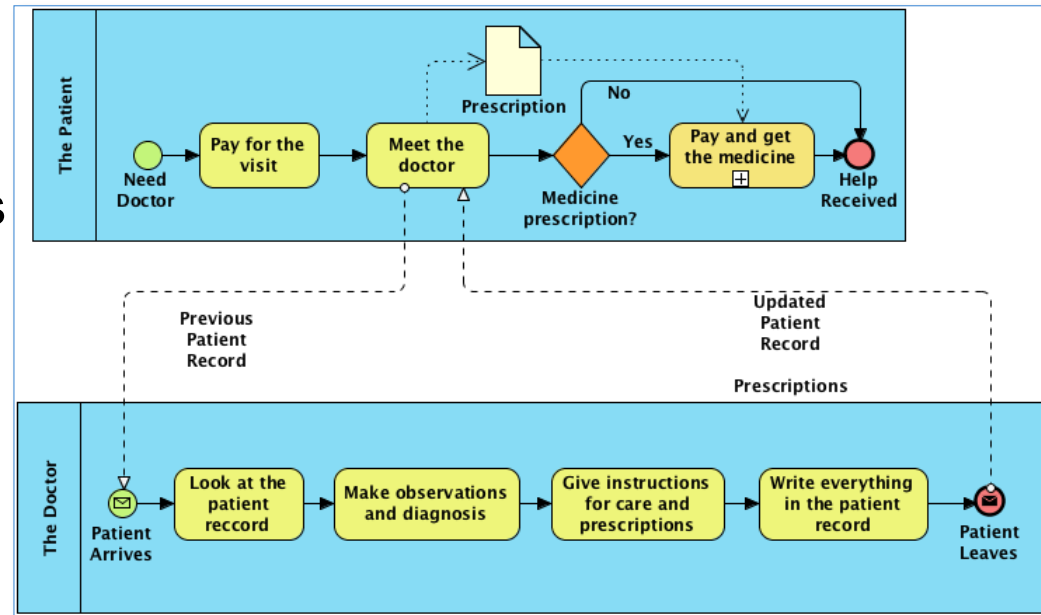

- ❑ The participant's processes can collaborate using messages
- ❑ Message flow always between pools
- ❑ Sequence flow always within a pool

The Core Process of an organization

Core Process characteristics

- ❑ The doctor's process gives a service to the patient
- ❑ Volumes in Happy Hospital
 - ❑ 1000 visits/day
 - ❑ 600 beds
 - ❑ 10 000 employees

Business Process Modeling Method steps

1. Define Process Scope
2. Create the Top Level diagram for the Happy Path
3. Add top-level exception paths
4. Expand sub-processes to show detail at child level
5. Add intermediate message flows to external pools

Discovering the processes

- ☐ What are the core processes?
- ☐ What are the support processes?
- ☐ Service orientation
 - ☐ Support processes give services to the core processes

What to improve? Process Orientation

- ☐ Clinical Process?
- ☐ Scheduling Process?
- ☐ Financial Process?
- ☐ Pharmacy Process?
- ☐ Other Processes?
- ☐ Health Record Management Process?
 - ☐ As-Is: Health Records are written in the book owned by the patient
 - ☐ Problems: A book can be in one place only. Other problems...

How to improve? Service Orientation

- ❑ Business Processes are composed of business services
 - ❑ Examples: Payment service, Patient record service
- ❑ Business Services are reusable components which can be used in many business processes
- ❑ Business Services can be implemented using software components, often web services
- ❑ The Benefits of using reusable components
 - ❑ Cost savings: Build once, use many times
 - ❑ Time savings: Use ready components instead of building from scratch
 - ❑ Risk management: Using ready components helps to control the risks

Discovering services

SOA

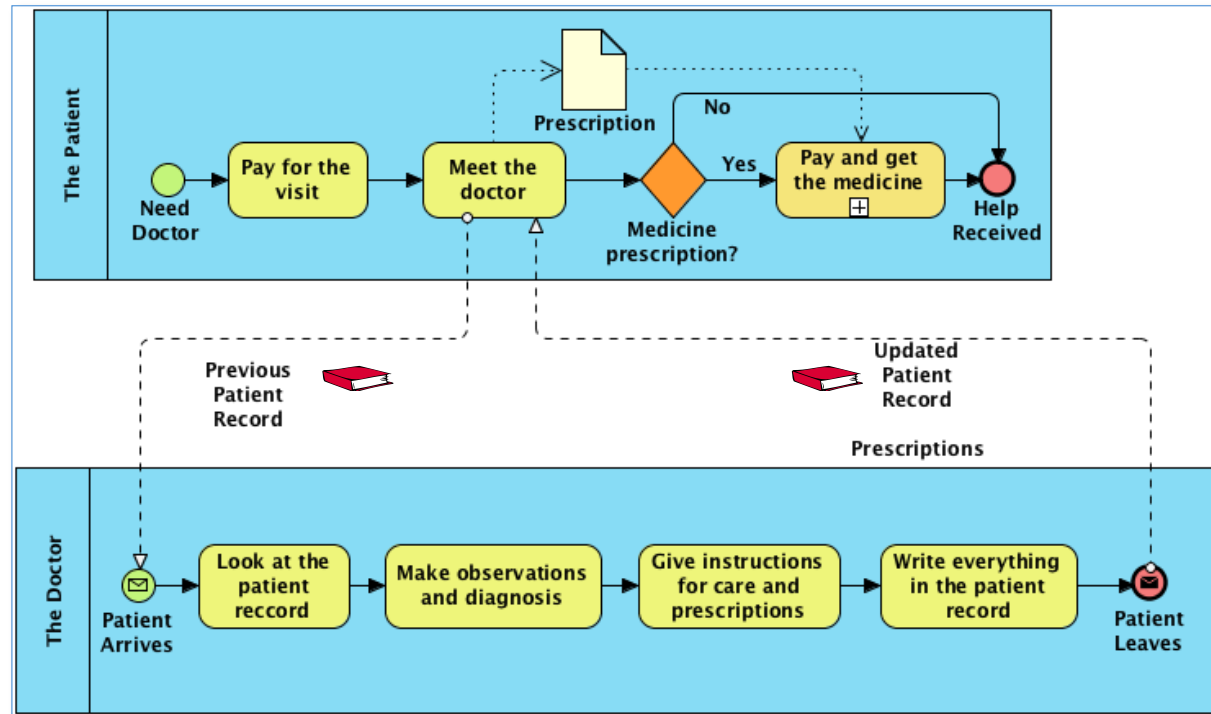

A service can be a task, a sub-process or a process

From As-Is to To-Be process

- ☐ Discussion about services
 - ☐ How to identify services
 - ☐ SOA Principles
- ☐ How the processes and services could be identified
 - ☐ Data oriented services (patient record)
 - ☐ Function oriented services (laboratory)
 - ☐ Process oriented services (the doctors workstation)
 - ☐ Notification oriented services (do we have any?..)

The Patient Record and the Doctor

- The patient owns the book

Laboratory included as a business service

- ❑ The Laboratory orders and results are on a separate paper form
- ❑ The doctor receives the results
- ❑ The patient pays for the laboratory and receives the results

Ideas for improvement regarding Patient Health Record

- ☐ Electronic Health Record?
- ☐ Discussion and collection of improvement ideas
 - ☐ What problems it could solve?
 - ☐ The patient could forget the paper book at home or lose it
 - ☐ The doctor has a bad handwriting
 - ☐ The laboratory results and other documents are on separate papers
 - ☐ What other opportunities EHR would give
 - ☐ The hospitals could share the patient records
- ☐ Other requirements
 - ☐ Privacy, Confidentiality, Authenticity and other security aspects
 - ☐ Support to other processes: Scheduling, Financial, etc...
 - ☐ Availability, Usability, Performance

Electronic Health Record as a service

- ❑ EHR could store all the doctors notes in a similar way as the patient record book
- ❑ It could store also the lab results and other information
- ❑ It could be accessible for the doctor and other professionals when needed
- ❑ It could also be accessible within the hospital and also outside the hospital like regional level

- ❑ It must guarantee the privacy, confidentiality and authenticity of the notes

How EHR service could be used?

- ❑ The doctor would start looking at the patient's EHR
- ❑ The lab results would be collected into the EHR
- ❑ The doctor would write all notes into the EHR
- ❑ The patient would get a paper copy or could also look at the EHR

How EHR could be implemented?

Option 1
Stand alone system

How EHR could be implemented?

Option 2

An application service which would offer services to other applications

Identifying Application Services

- ❑ EHR
 - ❑ Patient record management
- ❑ LIS
 - ❑ Laboratory order entry and results delivery
- ❑ Pharmacy system
 - ❑ Delivery of the medicine
- ❑ Doctor's systems
 - ❑ Coordination of the collaboration
- ❑ The Patient
 - ❑ Collaboration with the professionals

Implementing services as web services

- ❑ A **service** consists of one or multiple **operations**
 - ❑ A Message Exchange Pattern (MEP) is related to an operation
 - ❑ **Request-Response** operation
 - ❑ A service receives a request message and sends a reply message
 - ❑ **Solicit-Response** operation
 - ❑ A service sends a request message and waits for a reply message
 - ❑ **One-way** operation
 - ❑ A service receives a message
 - ❑ **Notification** operation
 - ❑ A service sends a message
 - ❑ A fault message can be replied (Fault)
- ❑ Applies to any programming language
- ❑ Services are **synchronous** or **asynchronous**

Implementing services as web services

Service: Electronic Patient Record

☐ Operations and messages

☐ EPRQuery

☐ In: EPR-QueryMessage

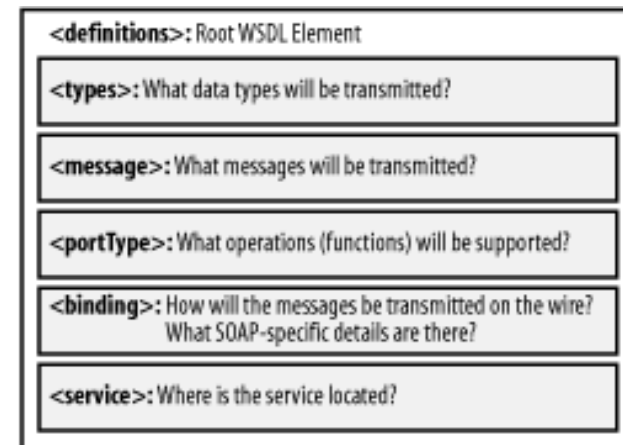

☐ Out: EPR-ReplyMessage

☐ EPRStore

☐ In: EPR-StoreMessage

☐ Web services are defined using web services definition language (WSDL)

The data model for the messages

- ❑ How do we define the messages in WSDL documents?
- ❑ We need a data model
- ❑ Transactional data
 - ❑ What happened
 - ❑ Encounter and Notes...
- ❑ Master Data
 - ❑ The “static data” that is referenced from the transactional data that describes business events
 - ❑ Hospital, Department, Doctor, Patient, Encounter Type...

Healthcare Information Model HL7 RIM

- ❑ RIM (Reference Information Model) is a generic health care data model
- ❑ HL7 CDA (Clinical Document Architecture) is a RIM based standard for exchange of clinical records

A standard for clinical documents

- HL7 CDA (Clinical Document Architecture) is a RIM based standard for exchange of clinical records
- EHR service can have the CDA documents as the payload in the messages

Extending the local EHR into regional EHR

A Regional EHR service could help in data exchange between hospitals

Summary: How BPMN helps in improving the processes

- ☐ Modeling the As-Is business processes
- ☐ Identifying areas of improvement
- ☐ Discovering reusable business services
- ☐ Modeling the To-Be business processes
- ☐ Discovering web services
- ☐ Helping in implementation of the web services
