

EXECUTING AN EXTERNAL BPMN FILE IN CAMUNDA

(IMPORTANT: LOGIN AND CREATE A CLUSTER WITH A RANDOM NAME AND THEN PROCEED WITH THE STEPS BELOW)

STEP1: CLICK ON NEW PROJECT

STEP 2: CLICK ON CREATE NEW AND IN THAT CLICK ON UPLOAD FILES AND CHOOSE YOUR BPMN FILE

STEP 3: CLICK ON YOUR BPMN FILE

Modeling is free, but your free process execution trial ends in 30 days [Contact us](#)

New project

Filter table [View landscape](#) [Create new](#)

Condition
Condition expression: `available=true`
[true literal](#)

Extension properties

Example data

Problems Variables

Check problems against: Camunda 8.8

STEP 4: CLICK ON THE OTHER SIDE OF THE CODITION AND GIVE THE SAME VARIABLE NAME AND THE VALUE AS FALSE

STEP 5: REPEAT THIS PROCESS FOR ALL THE CONDTIONS THEN IN THE MAIN PROPERTIES MAKE SURE EXECUTABLE IS CHECKED

STEP 5: CLICK ON DEPLOY AND RUN

STEP6: IN THE VARIABLES TEXTBOX DECLARE YOUR VARIABLE NAMES WITH TRUE VALUE IN JSON FORMAT(AS GIVEN BELOW),CLICK ON DEPLOY AND RUN

EXAMPLE JSON FORMAT:

```
{ "avail":true,  
  "app":true}
```

//this json checks for both conditions to be true in the bpmn flow

STEP 7: CLICK ON VIEW PROCESS INSTANCE ON RIGHT TOP CORNER

The screenshot shows the Camunda Modeler interface. The main workspace displays a BPMN diagram for a leave approval process. The process starts with a 'start' event, followed by a 'submit leave request' task. A decision diamond 'leave available?' branches the flow: if 'yes', it goes to 'request sent to manager'; if 'no', it goes to 'request rejected'. From 'request sent to manager', another decision diamond 'approved?' branches: if 'yes', it goes to 'leave confirmed' and then 'employee notified' to an 'end' event; if 'no', it goes to 'rejection message sent to employee' to an 'end' event. From 'request rejected', it goes to 'notification sent' to an 'end' event. The right sidebar shows the 'Properties' tab for the process, with fields for Name, ID, Version, and Version tag. A notification 'Instance started!' is visible in the top right corner.

The screenshot shows the Camunda Operate interface. The top bar displays the process details: Process Name: Process_00qpcpc, Process Instance Key: 4503599627382783, Version: 2, Start Date: 2026-01-21 14:52:37, End Date: 2026-01-21 14:52:37, Parent Process Instance Key: None, and Called Process Instances: None. The main area shows the BPMN diagram with the execution path highlighted in blue. The bottom section shows the 'Instance History' table with columns for Name, Value, and Execution count.

Name	Value	Execution count
start		1
submit leave request		1
leave available?		1
request sent to manager		1
approved?		1
leave confirmed		1
employee notified		1
end		1

THE OUTPUT IS HENCE VERIFIED

TO CHECK IF THE FLOW IS RIGHT FOR OTHER CASES CHANGE THE JSON CONDITIONS ACCORDINGLY AS NECESSARY.

THANK YOU.
