

DevOps

DevOps

- It is a design philosophy that merges Development and Operations utilizing a set of tools and practices.
- It bridges the gap between the development and operations teams and allows faster delivery.

DevOps

- It is a set of practices and cultural philosophies that aim to unify software development (Dev) and IT operations (Ops).
- DevOps fosters a culture of collaboration and shared responsibility by breaking down traditional barriers between developers and IT operations teams.
- The goal is to improve the software development lifecycle, ensuring faster, more efficient, and reliable delivery.

What is DevOps?

- DevOps word in itself is a combination of two words one is “Development,” and the other is “Operations.”
- It is neither an application nor a tool; instead, it is just a culture that collaboratively promotes development and operation.
- As a result of DevOps implementation, the speed to deliver applications and services has increased.

DevOps

- DevOps can be considered as an outgrowth of agile. It is simply extending the Agile principles beyond the boundaries of the code to the entire delivered services.

“

When you are going agile without DevOps, it is like racing with a tractor instead of a car. You can do laps, but it will not move faster, and ultimately you will waste a lot of fuel without having any fun.

”

“

DevOps is not a goal
but a never-ending process of continual improvement.

”

Traditional vs. Modern Software Delivery

Traditional

Waterfall approach

Different teams or organizational units for requirements, development, test and operations

Clear separation between business and IT (demand/supply)

Release software 2 or 3 times a year

Budget/cost driven

Modern

Agile, often scrum approach

Multidisciplinary teams where all disciplines work together on small piece to deliver

Business, development and operations in one team

Release multiple times a day

Value stream driven

“

Our highest priority is to satisfy the customer through early and continuous delivery of valuable software

-- 1st principle behind agile manifesto

”

Continuous Delivery

Continuous delivery is all about creating a repeatable and reliable process for delivering software in order to deliver high value software to our customers fast!

DevOps is the union of people, process, and products to enable continuous delivery of value to our end users.
